ADVERTISEMENT.

The following plates represent the appearance of variola at different stages of the eruption.

The first sixteen pictures show its appearance on the same patient, from the third to the fourteenth day, when it began to disappear. The patient entered the hospital on the ninth day of October, 1881, and remained until the second day of November following, when he was discharged well.

The remaining plates are of patients in the same hospital, and all were under the professional care of the City Physician of Boston.

SAMUEL A. POWERS,
Superintendent Small-pox Hospital, Boston.
